Midterm Part 1 of 3: Conway's Game of Life

Rubric	Maximum Points	Points Received
Serial implementation	5	
Blocked / Panel implementation	40	
Blocked / Panel demonstrated for np=4,9,25,36	10	
Table of bug counts for 1000, 2000, 3000, 10000 iterations for both serial and synchronous MPI with np=9	10	
Table of 1000 iteration bug counts for serial, and all of the listed parallel job sizes for both synchronous and asynchronous communication	10	
Discussion of implementation: debugging process, CGL test worlds and patterns that were used, etc.	10	
Animation	15	

Total: / 100

Additional grader remarks:

Midterm 1 Brandon Bell

I have produced data for the np = 4,9,25,36 for 1,000 iterations and np=9 for 10k iterations but, I have not yet reduced the data into final live counts. I had each process dump out the number of bugs alive in it's world for a given iteration and collected the output from all the processes into a text file. I need to add the pieces together from each process. The tail of np = 4 @ 1k look like this

```
[1,990,5964]
[1,991,5960]
[1,992,5962]
[1,993,5958]
[1,994,5964]
[1,995,5960]
[1,996,5962]
[1,997,5958]
[1,998,5964]
[1,999,5960]
and for 36 @ 1k

[8, 992, 1137]
[8, 993, 1140]
[8, 994, 1137]
[8, 995, 1139]
[8, 996, 1137]
[8, 997, 1140]
[8, 998, 1137]
[8,999,1139]
```

tail 4p-i1k.txt

The individual data files for each trial are included in my code tarball but I haven't printed them out. I did not finish the asynchronous or animation parts.

```
// How it works: // * One .cpp file -- usually the one that contains main(), includes this file // within #define __MAIN, like this:
                                                                                                                                                                   // <soapbox>
// This file contains global variables: variables that are defined throughout
// The entire program, even between multiple independent source files. Of
// course, global variables are generally bad, but they're useful here because
// it allows all of the source files to know their rank and the number of MPI
// tasks. But don't use it lightly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              int field_width; // Width and height of field on this processor
